## 2.3 QUICKSORT

---

- ▶ *quicksort*
- ▶ *selection*
- ▶ *duplicate keys*
- ▶ *system sorts*

# Two classic sorting algorithms: mergesort and quicksort

---

Critical components in the world's computational infrastructure.

- Full scientific understanding of their properties has enabled us to develop them into practical system sorts.
- Quicksort honored as one of top 10 algorithms of 20<sup>th</sup> century in science and engineering.

Mergesort. [last lecture]

Quicksort. [this lecture]

# Quicksort t-shirt

---

```
public static void quicksort(char[] items, int left, int right)
{
    int i, j;
    char x, y;

    i = left; j = right;
    x = items[(left + right) / 2];

    do
    {
        while ((items[i] < x) && (i < right)) i++;
        while ((x < items[j]) && (j > left)) j--;

        if (i <= j)
        {
            y = items[i];
            items[i] = items[j];
            items[j] = y;
            i++; j--;
        }
    } while (i <= j);

    if (left < j) quicksort(items, left, j);
    if (i < right) quicksort(items, i, right);
}
```

ALGORITHM 64  
QUICKSORT  
C. A. R. HOARE  
Elliott Brothers Ltd., Borehamwood, Hertfordshire, Eng.

```
procedure quicksort (A,M,N); value M,N;  
    array A; integer M,N;  
comment Quicksort is a very fast and convenient method of  
sorting an array in the random-access store of a computer. The  
entire contents of the store may be sorted, since no extra space is  
required. The average number of comparisons made is  $2(M-N) \ln$   
 $(N-M)$ , and the average number of exchanges is one sixth this  
amount. Suitable refinements of this method will be desirable for  
its implementation on any actual computer;  
begin    integer I,J;  
        if M < N then begin partition (A,M,N,I,J);  
            quicksort (A,M,J);  
            quicksort (A, I, N)  
        end  
end    quicksort
```

## Implementing Quicksort Programs

Robert Sedgewick  
Brown University

---

**This paper is a practical study of how to implement the Quicksort sorting algorithm and its best variants on real computers, including how to apply various code optimization techniques. A detailed implementation combining the most effective improvements to Quicksort is given, along with a discussion of how to implement it in assembly language. Analytic results describing the performance of the programs are summarized. A variety of special situations are considered from a practical standpoint to illustrate Quicksort's wide applicability as an internal sorting method which requires negligible extra storage.**

**Key Words and Phrases:** Quicksort, analysis of algorithms, code optimization, sorting

**CR Categories:** 4.0, 4.6, 5.25, 5.31, 5.5

### The Analysis of Quicksort Programs\*

Robert Sedgewick

Received January 19, 1976

*Summary.* The Quicksort sorting algorithm and its best variants are presented and analyzed. Results are derived which make it possible to obtain exact formulas describing the total expected running time of particular implementations on real computers of Quicksort and an improvement called the median-of-three modification. Detailed analysis of the effect of an implementation technique called loop unwrapping is presented. The paper is intended not only to present results of direct practical utility, but also to illustrate the intriguing mathematics which arises in the complete analysis of this important algorithm.

(stay tuned)

# Quicksort animation

---

50 random items

<http://www.sorting-algorithms.com/quick-sort>

- ▲ algorithm position
- in order
- current subarray
- not in order

## Quicksort: implementation details

---

**Partitioning in-place.** Using an extra array makes partitioning easier (and **stable**), but is **not worth the cost**.

**Terminating the loop.** Testing whether the pointers cross is trickier than it might seem.

 **Equal keys.** When duplicates are present, it is (counter-intuitively) better to stop scans on keys equal to the partitioning item's key.

**Preserving randomness.** Shuffling is needed for performance guarantee.

**Equivalent alternative.** Pick a random partitioning item in each subarray.

# Quicksort: empirical analysis (1961)

## Running time estimates:

- Algol 60 implementation.
- National-Elliott 405 computer.

**Table 1**

NUMBER OF ITEMS	MERGE SORT	QUICKSORT
500	2 min 8 sec	1 min 21 sec
1,000	4 min 48 sec	3 min 8 sec
1,500	8 min 15 sec*	5 min 6 sec
2,000	11 min 0 sec*	6 min 47 sec

\* These figures were computed by formula, since they cannot be achieved on the 405 owing to limited store size.

sorting N 6-word items with 1-word keys

**Elliott 405 magnetic disc  
(16K words)**

# Quicksort: empirical analysis

## Running time estimates:

- Home PC executes  $10^8$  compares/second.
- Supercomputer executes  $10^{12}$  compares/second.

computer	insertion sort ( $N^2$ )			mergesort ( $N \log N$ )			quicksort ( $N \log N$ )		
	thousand	million	billion	thousand	million	billion	thousand	million	billion
home	instant	2.8 hours	317 years	instant	1 second	18 min	instant	0.6 sec	12 min
super	instant	1 second	1 week	instant	instant	instant	instant	instant	instant

*إبطا* (arrow pointing to insertion sort)

*Best case* (arrow pointing to quicksort)

**Lesson 1.** Good algorithms are better than supercomputers.

**Lesson 2.** Great algorithms are better than good ones.

# Quicksort: best-case analysis

Perfectly balanced  
التقسيم عادل

Best case. <sup>not sorted</sup> Number of compares is  $\sim N \lg N$ .

\* Expected Running Time:

Good call: the sizes of L and G are each less than  $3s/4$ .

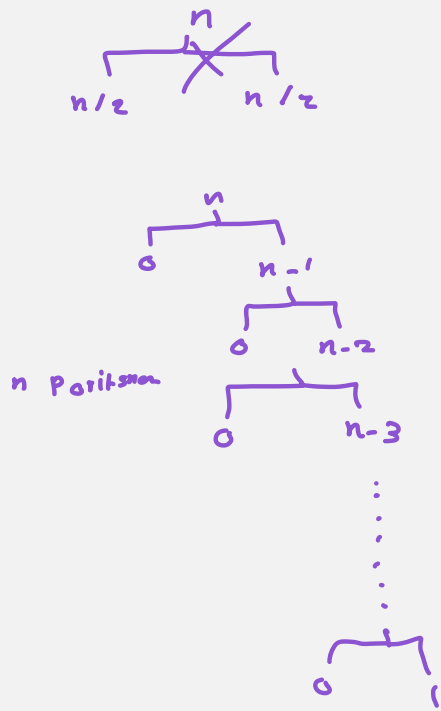

bad call: one of L and G has size greater than  $3s/4$ .

# Quicksort: average-case analysis

---

**Proposition.** The average number of compares  $C_N$  to quicksort an array of  $N$  distinct keys is  $\sim 2N \ln N$  (and the number of exchanges is  $\sim \frac{1}{3} N \ln N$ ).

*number of compares*

**Pf.**  $C_N$  satisfies the recurrence  $C_0 = C_1 = 0$  and for  $N \geq 2$ :

$$C_N = (N+1) + \left( \frac{C_0 + C_{N-1}}{N} \right) + \left( \frac{C_1 + C_{N-2}}{N} \right) + \dots + \left( \frac{C_{N-1} + C_0}{N} \right)$$

partitioning  
↓  
left   right  
↓   ↓  
partitioning probability

- Multiply both sides by  $N$  and collect terms:

$$NC_N = N(N+1) + 2(C_0 + C_1 + \dots + C_{N-1})$$

- Subtract from this equation the same equation for  $N-1$ :

$$NC_N - (N-1)C_{N-1} = 2N + 2C_{N-1}$$

- Rearrange terms and divide by  $N(N+1)$ :

$$\frac{C_N}{N+1} = \frac{C_{N-1}}{N} + \frac{2}{N+1}$$

# Quicksort: average-case analysis

- Repeatedly apply above equation:

$$\begin{aligned}\frac{C_N}{N+1} &= \frac{C_{N-1}}{N} + \frac{2}{N+1} \\ &= \frac{C_{N-2}}{N-1} + \frac{2}{N} + \frac{2}{N+1} \quad \leftarrow \text{substitute previous equation} \\ &= \frac{C_{N-3}}{N-2} + \frac{2}{N-1} + \frac{2}{N} + \frac{2}{N+1} \\ &= \frac{2}{3} + \frac{2}{4} + \frac{2}{5} + \dots + \frac{2}{N+1}\end{aligned}$$

previous equation

- Approximate sum by an integral:

$$\begin{aligned}C_N &= 2(N+1) \left( \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \dots + \frac{1}{N+1} \right) \\ &\sim 2(N+1) \int_3^{N+1} \frac{1}{x} dx\end{aligned}$$

- Finally, the desired result:

$$C_N \sim 2(N+1) \ln N \approx 1.39N \lg N$$

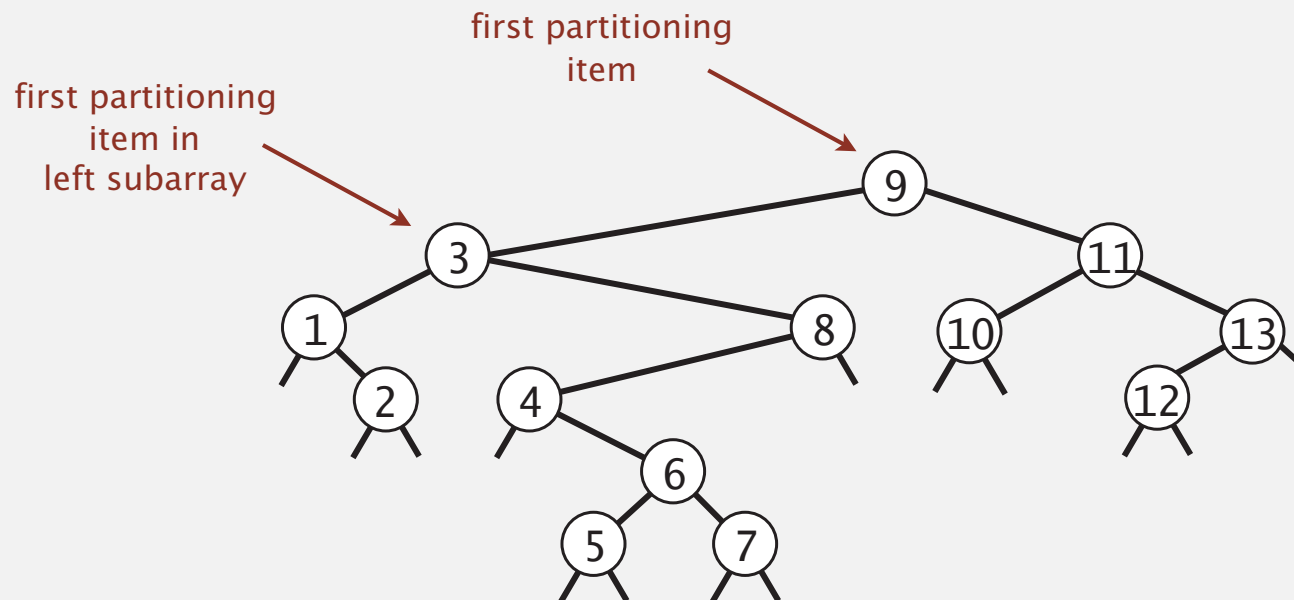

# Quicksort: average-case analysis

**Proposition.** The average number of compares  $C_N$  to quicksort an array of  $N$  distinct keys is  $\sim 2N \ln N$  (and the number of exchanges is  $\sim \frac{1}{3} N \ln N$ ).

**Pf 2.** Consider BST representation of keys 1 to  $N$ .

shuffle

 $\leq 2N \sum_{j=1}^N \frac{1}{j}$   
 $\sim 2N \int_{x=1}^N \frac{1}{x} dx$   
 $= 2N \ln N$

# Quicksort: summary of performance characteristics

---

Quicksort is a (Las Vegas) **randomized algorithm**.

- Guaranteed to be correct.
- Running time depends on random shuffle.

**Average case.** Expected number of compares is  $\sim 1.39 N \lg N$ .

- 39% more compares than mergesort.
- **Faster than mergesort** in practice because of less data movement.

**Best case.** Number of compares is  $\sim N \lg N$ .

**Worst case.** Number of compares is  $\sim \frac{1}{2} N^2$ .

[ but more likely that lightning bolt strikes computer during execution ]

# Quicksort properties

مرتبة بنفس المكان

**Proposition.** Quicksort is an **in-place** sorting algorithm.

not stable

**Pf.**

- Partitioning: constant extra space.
- Depth of recursion: logarithmic extra space (with high probability).

can guarantee logarithmic depth by recurring on smaller subarray before larger subarray (requires using an explicit stack)

**Proposition.** Quicksort is **not stable**.

**Pf.** [ by counterexample ]

# Duplicate keys: the problem

---

**Recommended.** Stop scans on items equal to the partitioning item.

**Consequence.**  $\sim N \lg N$  compares when all keys equal.

B A A B A B C C B C B

A A A A A A A A A A A

**Mistake.** Don't stop scans on items equal to the partitioning item.

**Consequence.**  $\sim \frac{1}{2} N^2$  compares when all keys equal.

الوضع اوس

B A A B A B B B C C C

A A A A A A A A A A A A

**Desirable.** Put all items equal to the partitioning item in place.

A A A B B B B C C C

A A A A A A A A A A A

# Sorting summary

	inplace?	stable?	best	average	worst	remarks
selection	✓		$\frac{1}{2} N^2$	$\frac{1}{2} N^2$	$\frac{1}{2} N^2$	$N$ exchanges
insertion	✓	✓	$N$	$\frac{1}{4} N^2$	$\frac{1}{2} N^2$	use for small $N$ or partially ordered
shell	✓		$N \log_3 N$	?	$c N^{3/2}$	tight code; subquadratic <span style="color: red;">not included</span>
merge		✓	$\frac{1}{2} N \lg N$	$N \lg N$	$N \lg N$	$N \log N$ guarantee; stable → يعكسها
timsort		✓	$N$	$N \lg N$	$N \lg N$	improves mergesort when preexisting order
quick	$\Theta(n)$ ✓		$N \lg N$	$2 N \ln N$	$\frac{1}{2} N^2$	$N \log N$ probabilistic guarantee; fastest in practice
3-way quick	✓		$N$	$2 N \ln N$	$\frac{1}{2} N^2$	improves quicksort when duplicate keys <span style="color: red;">not included</span>
?	✓	✓	$N$	$N \lg N$	$N \lg N$	holy sorting grail

# System sort in Java 7

---

## `Arrays.sort()`.

- Has method for objects that are Comparable.
- Has overloaded method for each primitive type.
- Has overloaded method for use with a Comparator.
- Has overloaded methods for sorting subarrays.

## Algorithms.

- Dual-pivot quicksort for primitive types.
- Timsort for reference types.

Q. Why use different algorithms for primitive and reference types?

## Summary of Sorting Algorithms

Algorithm	Time	Notes	#
selection-sort	$O(n^2)$	<ul style="list-style-type: none"><li>in-place</li><li>slow (good for small inputs)</li></ul>	
insertion-sort	$O(n^2)$	<ul style="list-style-type: none"><li>in-place</li><li>slow (good for small inputs)</li></ul>	
quick-sort	$O(n \log n)$ expected	<ul style="list-style-type: none"><li>in-place, randomized</li><li>fastest (good for large inputs)</li></ul>	
heap-sort	$O(n \log n)$	<ul style="list-style-type: none"><li>in-place</li><li>fast (good for large inputs)</li></ul>	
merge-sort	$O(n \log n)$	<ul style="list-style-type: none"><li>sequential data access</li><li>fast (good for huge inputs)</li></ul>	

SWAP:

	inplace?	stable?	best	average	worst
selection	✓		$O(n)$	$O(n)$	$O(n)$
insertion	✓	✓	compare $O(n^2)$ swap $O(1)$	$O(n^2)$	$O(n^2)$
